STATE BANK OF PAKISTAN

SBP Working Paper Series

Editor: Dr. Hamza Ali Malik

The objective of the SBP Working Paper Series is to stimulate and generate discussions, on different aspects of macroeconomic issues, among the staff members of the State Bank of Pakistan. Papers published in this series are subject to intense internal review process. The views expressed in the paper are those of the author(s) and do not necessarily reflect those of the State Bank of Pakistan.

Abstract

Arby (2008) quarterised the production side of annual GDP, and its subsectors, for 1972 to 2005 based on constant prices of 1999-2000 as well as on current prices. This study provides quarterly estimates of (sectoral and overall) gross domestic production in Pakistan during 1999-2000 to 2009-2010 based on constant prices of 1999-2000 as well as on current prices. Seasonality in quarterly gross domestic product in Pakistan mainly arises from agriculture. Furthermore, the study also provides estimates of various components of expenditures side of the GDP for 1972-1973 to 2009-2010 for the first time as far as we know.

Key words: Quarterisation, National Income Accounts

JEL Classification: E01, Y10

Acknowledgment

Authors would like to thank Ali Choudhary, Behzad Ali Ahmed, Farooq Arby, Farooq Pasha and Umar Siddique for their helpful comments on the earlier draft of the paper. Special thanks to Imran Naveed Khan for helping estimation of expenditure side of this study. Any errors or omissions are the responsibility of the authors. Finally, views expressed here are those of the authors and not necessarily of the State Bank of Pakistan.

Non-technical Summary

National Income Accounts (NIA) in Pakistan are regularly compiled by Pakistan Bureau of Statistics (PBS) on annual basis exclusively. PBS does not disseminate the NIA on quarterly basis which could provide a timelier picture than their annual counterpart.

Efforts have been made in the past by the researchers on the quarterisation of annual NIA of Pakistan (like Bengaliwala (1995), Kemal & Arby (2004) etc.). The most recent of such efforts is (Arby, 2008). Though, Arby (2008) provides the quarterly estimates of GDP and its production side sectors/subsectors (for 1972 to 2005) based on current prices and on constant prices of 1999-2000, it lacks production side quarterly estimates of GDP for the second half of the last decade and is silent over the quarterly estimates of expenditure side components of GDP.

We provide estimates of quarterly GDP from production side (both on current prices and on constant prices of 1999-2000) from 2000 to 2010 (the year up to which we have all desired data, necessary for quarterly NIA estimation) following Arby (2008). Combining quarterly GDP production side estimates for 1973-1999 based upon Arby (2008) and those for 2000 to 2010 from this study, we get quarterly GDP from production side for 1973 to 2010. Once we obtain quarterly GDP from production side for 1973 to 2010, we quarterise the expenditures side of the NIA. Quarterly estimates of overall gross fixed capital formation are worked out following Arby and Batool (2007). Government fixed capital formation is quarterised on the basis of quarterly proportion of government total development expenditures. Exports and imports are quarterised using monthly trade data of PBS. After quarterisation of government consumption expenditure on the basis of gross public services expenditure, private consumption expenditures are estimated as a residual.

These data will be useful for business cycle analysis and economic modeling. Of course, for understanding the economy's structure and long term trends, annual NIA are more useful.

1. Introduction

National Income Accounts (NIAs) present macro picture of income cycle of a country. It helps us know the sources of supply of goods and services (agriculture, industry and services) and the uses of the same (final consumption expenditures, gross capital formation, and exports). In Pakistan, Pakistan Bureau of Statistics (PBS) compiles Annual National Income Accounts (ANIA) based on UN System of National Accounts 1993¹. Some information is also available on monthly basis like large scale manufacturing (LSM) index². PBS does not disseminate Quarterly National Income Accounts (QNIA) which can provide timelier picture than ANIAs and more comprehensive than provided by the indicators like LSM index and merchandise imports/exports.

This study provides the estimates of the quarterly GDP from production as well as expenditures side (both on current prices and on prices of 1999-2000) and its various subsectors/components since 1972-73 following Arby (2008), and Arby and Batool (2007) by using available data.

QGDP production side estimates for 1973-1999 are based upon Arby (2008) while those for 2000-2010 are going to be worked out in this study following Arby (2008). Once we obtain QGDP from production side for 1973 to 2010 we will quarterise the expenditures side of the NIA. Quarterly estimates of overall gross fixed capital formation will be worked out following Arby and Batool (2007). Government fixed capital formation will be quarterised on the basis of quarterly proportion of government total development expenditures. Net exports will be quarterised using monthly trade data of PBS. After quarterisation of government consumption expenditures on the basis of gross public services expenditures, private consumption expenditures will be estimated as a residual.

With these datasets, researchers will be able to do better analysis of dynamic relationships between these aggregates and between these and other important aggregates (like broad money, consumer prices, etc.). Thus, these data will be useful for business cycle analysis and economic modeling. Of course, for understanding the economy's structure and long term trends ANIA are more useful³. Though, Arby (2008) provides the quarterly estimates of GDP and its production side sectors/subsectors (for 1972 to 2005) based on current prices and on constant prices of 1999-2000, it lacks production side quarterly estimates of GDP for the second half of the last decade and is silent over the quarterly estimates of expenditure side components of GDP.

There is need to provide the production estimates at least for the second half of 2010s. Since there are usually revisions in the NIA upto 3 years from the first release of the data, there

¹ The 1993 System of National Accounts (SNA 1993) is a comprehensive, consistent and flexible set of macroeconomic accounts to meet the needs of government and private sector analysts, policy makers and decision takers. It is a conceptual framework, not manual for compilations of NIAs. For that purpose a separate set of handbooks like 'Handbook of National Accounting,' is published by United Nations. SNA 1993 was prepared by Inter-Secretariat Working Group of National Accounts (ISWGNA) - which consists of IMF, EU, OECD, UN and WB – mandated by the Statistical Commission of United Nations to oversee the international coordination on the development of national accounts. Based on evolving needs of users, new developments in economic environment, and advances in methodological research ISWGNA has produced and released updated version SNA 2008. We would like PBS to compile and disseminate national income accounts on the basis of SNA 2008 as soon as possible. SNA 2008 is designed to accommodate the needs of countries at different stages of economic development.

² It is an index of the production of large scale manufacturing establishments in Pakistan registered under Factories Act, 1934 (for details see PBS, 2011). It is based upon production of 112 commodities as reported regularly in Monthly Statistical Bulletin of PBS. The weights in the construction of the index are based upon census of manufacturing industries (CMI) conducted in the country from time to time. Recent most weights are from PBS (2009).

³ For example, changes in the share of agriculture in overall income changes in decades and not in quarters.

is also a need to reassess the quarterly GDP even from 1999-2000. We have estimated quarterly GDP from production side from 1999-2000 to 2009-2010 (the year up to which we have all desired data, necessary for quarterly NIA estimation). We also provide the quarterly estimates of various components of expenditures side of the NIAs for FY1973-FY2010.

The remaining of this paper is organised as follows. Section 2 presents some review of literature. Section 3 describes the methodology to estimate the quarterly NIA (sector-wise as well as sub-sector wise) from production side. In section 4 we discuss (component wise) the approach adopted to estimate the QNIA from expenditures side. The estimates of quarterly NIA (overall as well as component-wise) are presented in appendices: Appendix A presents time series of quarterly GDP (Real) from production side for 1999-00 to 2009-10. Appendix B presents time series of quarterly GDP (Nominal) from production side for 1999-00 to 2009-10. In these appendices (A and B) sector and subsector wise quarterly estimates are provided from production side worked in this study. Appendix C combines the quarterly proportion for GDP(FC) obtained in Arby (2008) for 1972-73 to 1998-99 and those estimated in this study for 1999-00 to 2009-10. For combined period of 1972-73 to 2009-10 we have provided current as well real quarterly GDP(FC) in Appendix D. Appendices E1 to E11 present quarterly estimates of various components of expenditures side of GDP. Appendix E12 contains quarterly estimates of net factor income from abroad. Appendices F, G and H present QGD(MP), QGNP(FC) and QGNP(MP) respectively. In section 5 some observations presented based on the quarterly estimates of GDP are analyzed. The last section presents concluding remarks.

2. Literature Review

The past efforts on the quarterisation of ANIA of Pakistan include a recent study (Arby, 2008) on the issues of NIAs of Pakistan. It provides a very good account of the relevant literature. Earlier studies on the estimates of Pakistan's QNIAs include Bengaliwala (1995), Kemal and Arby (2004), and Arby (2008). Bengaliwala (1995) and Kemal and Arby (2004) quarterise old base (1980-81) GDP data and these studies considered only the contact prices and production side of NIAs. None of these studies provide the latest estimate for quarterly production in Pakistan, which we have provided in this study (up to Q4-FY2010)

Arby and Batool (2007) quarterised the overall gross fixed capital formation for 1972 to 2006. However, our study provides the quarterly private and public sector gross fixed capital formation separately in addition to overall gross fixed capital formation. This study attempts to fill this gap of previous studies by providing quarterly estimates of various components of expenditures side of the NIAs for 1972-73 to 2009-10.

3. Methodology-Production Side

For quarterisation of production side we have followed the methodology used in Arby (2008) and re-estimated the quarterly production for the period of 1999-00 to 2009-10. In the following subsections we discuss the quarterisation process for different sectors and subsectors of the economy.

3.1 Agriculture Sector

This sector consists of five subsectors, major crops, minor crops, live stocks, fishing and forestry. How quarterly estimates of gross value added of these sub-sectors (for FY00 to FY10) are obtained is detailed below.

3.1.1 Major Crops

The value added of 12 major crops ($VAMC_t$)⁴ has been quarterised ($VAMC_t^q(c)$; $c = 1, 2, \dots, 12$; t is time (year) script and $q = 1, 2, 3, 4$) using

- Province-wise each major crop production ($PRMC_t(p, c)$; $p = 1, 2, 3, 4$ and $C = 1, 2, \dots, 12$) taken from Agriculture Statistics of Pakistan (various issues)
- Share of each major crop in annual value added (calculated from information (a) above) of major crops in Pakistan (S^c ; $c = 1, 2, \dots, 12$; $\sum_{c=1}^{12} S^c = 1$)
- Annual value added of major crops in Pakistan ($VAMC_t(c)$; $c = 1, 2, \dots, 12$) on constant prices of 1999-2000
- Province-wise quarterly harvest calendar⁵ of each of the 12 major crops prepared by PBS.

The quarterly value added at 1999-00 prices for quarter q year t is then obtained as follows. Province-wise each major crop production is converted into quarterly province-wise each major crop production ($PRMC_t^q(p, c)$; $p = 1, 2, 3, 4$ and $c = 1, 2, \dots, 12$) based upon province-wise quarterly harvest calendar. This is then summed up over provinces to get quarter-wise each major crop production, i.e.

$$PRMC_t^q(c) = \sum_{p=1}^4 PRMC_t^q(p, c) \quad \text{for } c = 1, 2, \dots, 12$$

Based on the share of each major crop in annual valued added of major crops we obtain the value of each crop, i.e.

$$VAMC_t(c) = S^c * VAMC_t; \quad c = 1, 2, \dots, 12; \quad \sum_{c=1}^{12} S^c = 1).$$

This annual valued added of each major crop is then divided into four quarters based upon quarter-wise proportion of each major crop production, i.e.

$$VAMC_t^q(c) = VAMC_t(c) * [PRMC_t^q(c) / \sum_{q=1}^4 PRMC_t^q(c)]$$

Summing this over 12 major crops we get quarterly value added of major crops $VAMC_t^q$ on constant prices of 1999-2000. Then we convert the constant prices quarterly value addition to current prices using quarterly a price index of major crops (constructed using WPI prices of relevant major crops) as data on Producer Price Index (which is used by PBS) is not (publically) available.

3.1.2 Minor Crops

The value added by 37 minor⁶ crops has been quarterised by the same process as major crops except that harvest calendar used here is related to minor crops. We convert the constant

⁴ These include wheat, rice (basmati, iri and others), bajra, jowar, maize, barley, gram, sugarcane, rapeseed & mustard, and sesamum, cotton, and tobacco.

⁵ Pakistan Bureau of Statistics has prepared harvest calendar for each of the major (as well as minor) crop and for each of the province, on the basis of output harvested in every quarters. For example in the case of sugarcane production in Punjab, 0 percent of sugarcane of the crop is harvested in Jul-Sep, 15 percent in Oct-Dec, 80 percent in Jan-Mar and 5 percent in Apr-Jun. These proportions are 0, 38, 61 and 1 in Sindh; 0, 50, 50, and 0 in case of Khyber Pakhtonkhawah; and 0, 0, 100 and 0 in case of Baluchistan for Jul-Sep, Oct-Dec, Jan-Mar, and Apr-Jun respectively. Though such calendar has practical merit in using it for quarterisation of output, it does not consider economic activities pertaining to sowing of the crops which may have happened in some earlier quarters. Furthermore, one might not expect shocks to the harvest calendar over the short run however, over the long run there can be changes in the crops pattern across the quarters and/or provinces.

prices quarterly value addition to current prices using quarterly a price index of minor crops (constructed using WPI prices of relevant minor crops).

3.1.3 Live Stocks

There are two main contributors on live stocks; Milk and other. Other includes natural growth of animals, draught power, dung and urine, wool, poultry etc. Share of milk in total livestock value addition is found to be around 60 percent (or, $m_t = 0.60$) on the basis of authors estimates based upon annual relevant statistics on milk and others. Following Kemal and Arby (2004), we can say that peak production of milk is obtained in winter. Kemal and Arby (2004) stated that 35 percent of milk production was received in summer (which they divided equally for first and fourth quarter) and 65 percent was obtained in winter season (which they divided in second and third quarter in proportion of 35:30 since third quarter is relatively warmer than the second one). The rest of the value added in the live stock is distributed equally in the four quarters. Thus,

$$VALS_{1t} = VALS_{4t} = VALS_t * (0.175m_t + 0.25(1 - m_t))$$

$$VALS_{2t} = VALS_t * (0.35m_t + 0.25(1 - m_t)); VALS_{3t} = VALS_t * (0.30m_t + 0.25(1 - m_t)).$$

We convert the constant prices quarterly value addition to current prices using quarterly wholesale price index of fresh milk, eggs, chicken and meat.

3.1.4 Fishing

Fishing consists of marine fishing and land (farm) fishing. Following Kemal and Arby (2004) it is assumed that marine fish makes about 30 percent of the total value added of fishing and the rest 70 percent is from land fish. Following seasonal pattern for marine and land fish are reported by PBS (2002).

Table 1: Seasonal factors of Fishing				
Years\Quarters	Jul-Sep	Oct-Dec	Jan-Mar	Apr-Jun
Marine Fish	0.2012	0.3069	0.2365	0.2554
Land Fish	0.1121	0.2735	0.3498	0.2646

Source: PBS (2002)

Thus quarterly value added of fishing is calculated as $VAF_t^q = (0.3 * mf_q + 0.7 * nf_q) * VAF_t$. Where VAF_t^q = Value added of fishing in quarter q of year t, VAF_t = Value added of fishing in year t, mf_q = Share of Marine Fish in quarter q, nf_q = Share of Land Fish in quarter q. We convert the constant prices quarterly value addition to current prices using quarterly wholesale price index of fish.

⁶ These include mash, masoor, mung, mattar, other pulses, tomato, potato, other vegetables, groundnuts, soybean, sunflower, safflower, canola, linseed, castro seed, mango, banana, apple, citrus fruits, dates, guava, apricot, peach, pears, plums, grapes, pomegranate, almonds, chillies, onion, garlic, turmeric, ginger, Other condiments, gouar seeds, fodder crops, and sugar beet.

3.1.5 Forestry

Annual value added by forestry sub sector is divided into quarterly value additions using quarterly proportion 0.2009, 0.2561, 0.2882, and 0.2548 estimated by Quaidian Economic Consultants (2001). We convert the constant prices quarterly value addition to current prices using quarterly wholesale price index of timber and firewood.

The overall estimated quarterly gross value added by agriculture sector (at 1999-2000 prices) is shown below:

3.2 Industrial Sector

Industrial sector consists of six subsectors: mining and quarrying; small size manufacturing; large scale manufacturing; slaughtering; construction; and electricity, water & gas supply. The detailed process of quarterisation of gross value added by these sub-sectors (for FY2000 to FY2010) is given below.

3.2.1 Mining and Quarrying

This subgroup consists of aragonite marble, agri-clay, silica sand, gypsum, lime stone, ordinary stone, rock salt, coal, copper, copper blister, Iron ore, bauxite, barites, bentonite, celestite, china clay, chalk, chromites, dolomite, laterite, feldspar, fire clay, fluorite, fuller's earth, magnesite, manganese, ochres, ordinary sand, soap stone, sulphur, erby stone, phosphate, allied services, minerals exploration establishments, natural gas, and crude oil. Monthly production of these items (except phosphate, allied services and minerals exploration establishments) is available in Monthly Statistical Bulletin (PBS). We multiply monthly production with base year prices to make quarterly gross value. Summing over the monthly gross values we calculate the quarterly gross values. Annual gross value of phosphate, allied services and minerals exploration establishments has been distributed into quarterly according to quarterly ratios of addition of items for which monthly production is available. Quarterly value

addition is calculated by subtracting input costs from the gross value⁷. We convert the constant prices quarterly value addition to current prices using composite quarterly wholesale price index of coal and natural gas (with their respective share in total mining output as weights).

3.2.2 Manufacturing

a) Large-scale Manufacturing

Annual value added by large scale manufacturing (LSM_y) is quarterised on the basis of quarterly shares of large scale manufacturing calculated using monthly large scale manufacturing index⁸ (from PBS Monthly Statistical Bulletin), i.e.;

$$LSM_{qy} = \left[\frac{\sum_{m=3k-2}^{3k} LSM_{my}}{\sum_{m=1}^{12} LSM_{my}} \right] \cdot LSM_y$$

Where LSM_{qy} is value added by large scale manufacturing sector in quarter q and fiscal year y and LSM_{my} is monthly index of large scale manufacturing of month m and year y. We convert the constant prices quarterly value addition to current prices using wholesale price index of manufacturing.

b) Small-scale Manufacturing

Annual value added by small scale manufacturing (SSM_y) is also quarterised on the basis of monthly large scale manufacturing index (on the basis of backward and forward linkages between these two sectors) using

$$SSM_{qy} = \left[\frac{\sum_{m=3k-2}^{3k} LSM_{my}}{\sum_{m=1}^{12} LSM_{my}} \right] \cdot SSM_y$$

Where SSM_{qy} is value added by small scale manufacturing sector in quarter q and fiscal year y and LSM_{my} is monthly index of large scale manufacturing of month m and year y. Again, we convert the constant prices quarterly value addition to current prices using wholesale price index of manufacturing.

c) Slaughtering

Annual value added by slaughtering (both at constant and current prices) has been quarterised using shares estimated in PBS study on slaughtering industry (PBS, 2002a). These are, 18, 25, 35 and 22 percent for quarter 1, 2, 3 and 4 respectively.

3.2.3 Construction

Annual value added by construction is quarterised on the basis of (lagged) quarterly seasonal factors in cement production (taken from PBS Monthly Statistical Bulletin). That is

⁷ Input costs proportions (of output) of coal, crude oil & natural gas, surface minerals, allied services/mineral exploration, and other minerals are 0.24, 0.23, 0.21, 0.47 and 0.21 respectively (Pakistan Bureau of Statistics, 2004).

⁸ Since monthly large scale manufacturing index is based upon the actual monthly large scale manufacturing output, we can use this index for quarterisation of value added of large scale manufacturing sector.

$$VA_Construction_{1,t} = VA_ConstructionV_t \times \frac{Cement_{4,t-1}}{Cement_t}$$

$$VA_Construction_{2,t} = VA_ConstructionV_t \times \frac{Cement_{1,t}}{Cement_t}$$

$$VA_Construction_{3,t} = VA_ConstructionV_t \times \frac{Cement_{2,t}}{Cement_t}$$

$$VA_Construction_{4,t} = VA_ConstructionV_t \times \frac{Cement_{3,t}}{Cement_t}$$

Where $VA_Construction_{k,t}$ is the (quarterly) value added of construction in quarter k and year t and $VA_Construction_t$ is the (annual) value added of construction in year t. Similarly, $Cement_{k,t}$ is the (quarterly) value added of cement in quarter k and year t and $Cement_t$ is the (annual) value added of cement in year t.

We convert the constant prices quarterly value addition to current prices using quarterly wage index, which is obtained by applying seasonal factors of wholesale price index of building material to annual wage index.

3.2.4 Electricity, water & gas supply

Annual value added by this sub-sector is quarterised on the basis of quarterly factors according to the study on electricity, gas & water supply (PBS, 2002b). The quarterly pattern of consumption of this group is given as;

Consumption pattern of electricity, gas & water supply sector

Group\Quarters	Jul-Sep	Oct-Dec	Jan-Mar	Apr-Jun
Electricity, gas & water supply	0.245	0.246	0.233	0.275

Source: PBS (2002b)

Annual value added by this sub-sector is given in different issues of Monthly Statistical Bulletin of PBS. The above factors are applied on annual value added of this sub-sector to get its quarterly estimates.

We convert the constant prices quarterly value addition to current prices using wholesale price index of 'fuel and lighting' for electricity and gas; and general wholesale price for water.

The overall estimated quarterly gross value added of industrial sector (at 1999-00 prices) is shown below:

3.3 Services

This sector consists of six subsectors: wholesale and retail trade; transport, storage, and communication; finance and insurance; ownership of dwellings; public administration, and defense and; social community, and personal services. How quarterly estimates of gross value added by these sub-sectors (for FY00 to FY10) are obtained is detailed below.

3.3.1 Wholesale and Retail Trade

PBS estimates the annual value added by this subsector by applying trade margins, which is 16 percent, on (i) imports related trade, and (ii) marketable portions of domestic production. Annual value added by first component of this subsector is obtained as 16 percent of sum of a) consumer goods, b) 75 percent of raw material for consumer goods, and c) 55 percent of capital goods, and raw material for capital goods imports. Annual value added by second component is obtained as residual from overall value added by wholesale and retail trade. Annual value added by (i) and (ii) is quarterised on the basis of seasonal factors of imports and commodity producing sector respectively. We convert the constant prices quarterly value addition of first component to current prices using wholesale price index. However, the constant prices quarterly value addition of second component is converted to current prices using quarterly unit value index of imports (base 1999-2000).

3.3.2 Transport, Storage and Communication

This subsector covers economic activities such as transportation by railways, road, water and air; storage; pipelines for oil and gas transportation; postal services, telecom services, TV, Radio, etc. Because of the absence of quarterly (time series) information about the value addition by any of these services, we do not have any quantifiable base to quarterise the output by transport, storage and communication subs sector. However, Lisman and Sandee (1964) provide

a procedure for quarterisation of value addition of a sector/subsector where we do not have any other information set to assume the pattern of actual (quarterly fluctuations). Lisman and Sandee (1964) developed the following matrix to quarterise the annual value addition:

$$\begin{bmatrix} x_{1t} \\ x_{2t} \\ x_{3t} \\ x_{4t} \end{bmatrix} = \begin{bmatrix} 0.073 & 0.198 & -0.021 \\ -0.010 & 0.302 & -0.042 \\ -0.042 & 0.302 & -0.010 \\ -0.021 & 0.198 & 0.073 \end{bmatrix} \begin{bmatrix} X_{t-1} \\ X_t \\ X_{t+1} \end{bmatrix}$$

Where X_t is annual observation for year t, and x_{jt} is quarterly estimate for quarter j in year t⁹. We convert the constant prices quarterly value addition to current prices using wholesale price index of transport and communication.

3.3.3 Finance and Insurance

PBS estimates the annual value added by this subsector by summing wages, net operating surplus and depreciation pertaining to State Bank of Pakistan, scheduled and non-scheduled banks, development financial institutions (DFIs), cooperative societies, leasing, modarbas and insurance companies. Wages related part of value addition is quarterised by using the methodology given below under the “Public Administration and Defense.” The operating surplus is quarterised by using seasonality in monetary aggregate (M2)¹⁰. Depreciation is distributed over the four quarters uniformly. We convert the constant prices quarterly value addition to current prices using consumer price index.

3.3.4 Ownership of Dwelling

Annual gross value addition of this subsector is quarterised following Lisman and Sandee (1964) method. We convert the constant prices quarterly value addition to current prices using house rent index.

3.3.5 Public Administration & Defense

PBS estimates the annual value added by this subsector based upon three components (a) wages and salaries of government employees, (b) a non-wage bill which is computed by PBS as a fixed ratio of 10% of wages, (c) and depreciation which is computed by PBS as a fixed ratio of 5% of the sum of wage and non-wage bills. While we have uniformly distributed non-wage bill and depreciation into four quarters, the wages are quarterised using the following methodology:

⁹ Lisman and Sandee (1964) method ensures: a) that the sum of quarterly figures equal to the yearly total; b) that if the yearly totals in three successive years are X_{t-1} , X_t and X_{t+1} , the quarterly figures during year 2 are the same but in reverse order from what they would have been had the yearly totals been X_{t+1} , X_t and X_{t-1} ; c) that if the yearly totals in three successive years rise by equal steps ($X_t - X_{t-1} = X_{t+1} - X_t$) the quarterly figures during year 2 also rise by equal steps; and that if $X_t - X_{t-1} = X_t - X_{t+1}$ the quarterly figures during year 2 should lie on sinusoid.

¹⁰ Operating surplus of financial subsector is mainly the income from assets of banks created during the period in the forms of lending which constitute part of broad money (M2).

In a fiscal year the wages remain constant for the first six months and then jump upward due to annual increment (usually 5 percent on average¹¹) in January and then again remain constant for the subsequent months. The wages and salaries are quarterly distributed as under;

Let $MWAS_t$ represents the monthly wages and salaries during the first half of fiscal year t, and i represents annual increment as fraction of $MWAS_t$. Then monthly wages and salaries for the second half will be $(1 + i) \times MWAS_t$. Thus, total wages and salaries ($AWAS_t$) during the year t will be:

$$AWAS_t = 6 \times (MWAS_t + MWAS \times (1 + i)) = 6MWAS_t(2 + i)$$

Fraction of wages and salaries in each quarter will be;

$$F_{1t} = F_{2t} = \frac{3 \times MWAS_t}{AWAS_t} = 0.5/(2 + i)$$

$$F_{3t} = F_{4t} = \frac{3 \times (1+i)MWAS_t}{AWAS_t} = 0.5(1 + i)/(2 + i) \dots \dots \dots \dots \dots \dots \dots \dots \dots \dots \dots$$

The quarterly seasonal factors for Jul-Sep, Oct-Dec, Jan-Mar, and Apr-Jun are found to be 0.244, 0.244, 0.256, and 0.256 respectively.

. We convert the constant prices quarterly value addition to current prices using consumer price index.

3.3.6 Social, Community & Personal Services

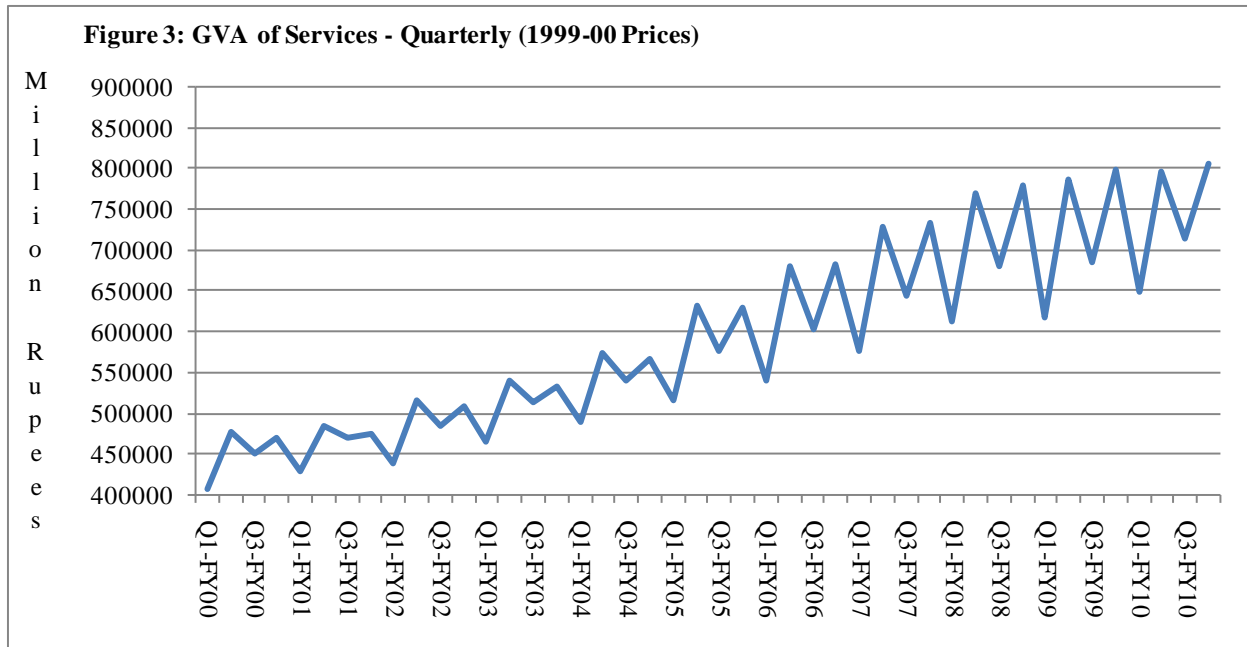

Annual gross value addition of this subsector is quarterised following Lisman and Sandee (1964) method. We convert the constant prices quarterly value addition to current prices using consumer price indices for cleaning laundry & personal appearance, and recreation, entertainment & education groups combined with their respective weights in CPI basket.

As reported in Table 7.1.1 of Arby (2008), (real) GDP estimates of Pakistan Bureau of Statistics after 1999-2000 are over estimated by around 1 percent compared to Arby (2008). We have quarterised the PBS released GDP (Factor Cost) for 1999-2000 and onward.

Those who want to make use of previous (1971-72 to 1998-99) as well as our estimates (1999-00 to 2009-10) of quarterly GDP they can use the table (Appendix C) showing quarterly proportions of GDP for 1971-72 to 1998-99 based on Arby (2008) and for 2000-01 to 2009-10 based on this study. Combining the two studies' estimates is convenient as for the year 1999-00 the quarterly proportions of real GDP are same from both the studies up to two decimal places. This approach can be used in case of other sectors and subsectors of the GDP to make combined datasets for 1972-73 to 2009-10.

The overall estimated quarterly gross value added by services sector (at 1999-2000 prices) is shown below in figure 3. In figure 4, we have presented the time series plot of overall real quarterly GDP (FC).

¹¹ Periodic budgetary increases in salary are taken care in annual figures and do not affect the monthly distribution of wages and salary

As observed, the seasonal patterns of services sector are closest to those of overall GDP. The same thing can be observed by analyzing the seasonal dispersion worked out in Table I2 in the Appendix.

4. Methodology-Expenditure Side

For quarterisation of expenditure side of the annual national income components for 1972-73 to 2009-10 we assume production side quarterly GDP equals the sum of quarterly components of national income. This assumption helps us finding quarterly private consumption expenditures as a residual¹² once we estimate quarterly government consumption expenditures,

¹² In the (annual) National Income Accounting System of Pakistan private consumption is actually treated as residual (see Baqai, 1963).

quarterly overall (private as well as government) investment and imports and exports of goods and services. We can quarterise the annual components of GDP using either direct or indirect way. We use direct way when we have basic data for quarterly (or even at higher) frequency as in the case of exports and imports of goods and services. We use indirect way, like the use of relevant indicators, when we do not have required data available at quarterly frequency as in the case of quarterly public sector investment expenditures prior to Q1FY02. In the following we explain the procedure used to quarterise these annual components of GDP.

4.1 Investment

Quarterly gross fixed capital formation (GFCF) has been estimated for 1972 to 2006 by Arby and Batool (2007). Using commodity flow approach Arby and Batool (2007) disaggregated GFCF into four components namely: machinery and equipment (M,), furniture and fixture (R), land improvement (L) and structure (S). Machinery and equipment is further divided into imported machinery and equipment (MF) and domestic machinery and equipment (MD). That is

$$GFCF_t = M_t + R_t + L_t + S_t ; \text{ where } M_t = MF_t + MD_t$$

These components are then quarterised using combination of direct and indirect way. For imported machinery and equipment we already have quarterly imports under the heading ‘capital imports’ from monthly bulletin of PBS. All other components are quarterised using indirect way that is on the basis of (quarterly) seasonality in the relevant indicator for which quarterly data is available. Following table shows the components, relevant indicators and their data sources. This last column of this table shows the deflator used for converting current prices investment components data into 1999-2000 prices data.

Investment Component	Relevant Indicator	High Frequency Data Source	Deflator
MF	Quarterly imported machinery and equipment	Monthly Bulletin of PBS	Unit values index of imports
MD	Quarterly LSM ‘machinery and equipment’ sub-index (estimated by using relevant items and their weights)	Monthly Bulletin of PBS	WPI manufacturing
S	Quarterly LSM ‘building material’ sub-index	Monthly Bulletin of PBS	WPI building material
L	Quarterly valued added of crops (with two quarters lead - assuming investment activity is undertaken before/during sowing of crops)	Arby (2008) and this study	WPI food
R	Five percent of quarterly ‘structure’ (as is the case with annual NIA estimates)	This study	WPI building material

Source: Arby and Batool (2007)

The quarterly GFCF is then estimated by summing the quarterly values of all these components. We estimated the GFCF both based on current prices and based on 1999-2000 prices. It helped us to estimate the overall investment deflator.

4.1.1 Government Investment Expenditures

The annual estimates of GFCF in Pakistan are primarily constructed separately for private and government sectors. Problem with the Arby and Batool (2007) is that they quarterised overall GFCF rather than quarterisation of private and government investment separately. However, sometimes, researchers are in need of analysing the private and public sector investment behaviour separately. In addition to estimating the overall investment, we have also attempted to quarterise the government sector investment separately as we explain here in this subsection.

Government investment is measured as total development expenditure (TDE) by the government. TDE includes the expenditures on public sector development program (PSDP) and other development expenditures. Quarterly TDE data is available from the fiscal operations statistics of ministry of finance, government of Pakistan, since the first Q1FY02. The average quarterly proportion of Q1FY02 to Q4FY10 of TDE has been used to quarterise the annual public sector investment for FY73 to FY01.

Year	Actual Quarterly Shares of TDE			
	Jul-Sep	Oct-Dec	Jan-Mar	Apr-Jun
2001-02	10.9223	30.2384	32.8802	25.9590
2002-03	16.7900	23.0352	23.9633	36.2115
2003-04	15.4791	19.8790	17.5881	47.0538
2004-05	14.0419	21.7888	24.7082	39.4611
2005-06	13.8980	21.2423	20.7927	44.0670
2006-07	15.5550	18.8592	21.8977	43.6880
2007-08	24.5615	24.3882	23.4411	27.6093
2008-09	12.6446	16.8657	24.6720	45.8178
2009-10	17.7678	18.8569	20.0187	43.3566
Average	15.74002	21.68374	23.32911	39.24712

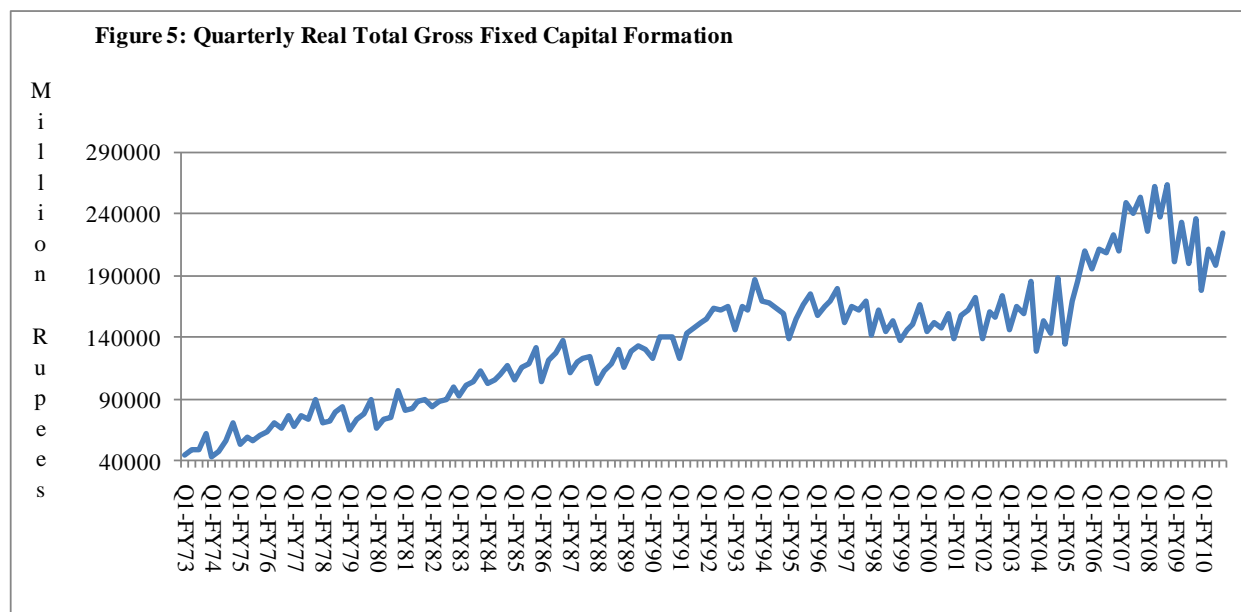

Source: authors' calculations

We have used overall quarterly investment deflator (estimated as in section 4.1) to convert quarterly nominal government investment expenditures into quarterly government investment expenditures based on 1999-2000 prices.

4.1.2 Private Sector Investment

Subtracting quarterly public sector investment estimated as in section 4.1.1 from the overall quarterly investment estimated as discussed in section 4.1 we obtain the quarterly private sector investment.

The overall estimated quarterly gross fixed capital formation (at 1999-00 prices) is shown below¹³:

4.2 Imports and Exports of Goods and Services

Imports of goods and services are the components where we use the direct way of estimating the quarterly data from monthly information. Data on merchandise imports and exports are available from PBS in local currency (Pak Rupee). Data on non-factor services and other current transfers are obtained from SBP's monthly balance of payments statistics in US\$ which are converted into local currency (Pak Rupee) by using local currency per US\$ (average) exchange rate. Quarterly imports and exports of goods and services are reported in Appendix E.

4.3 Government Consumption Expenditures

To estimate the quarterly government consumption expenditures (GCE), the expenditures under General Public Service (GPSE) has been used as an indicator of GCE. The quarterly data is available for GPSE Q1FY02. The GPSE comprises of interest payments (domestic as well as

¹³ One may be interested in knowing why there was stagnancy (fall) in investment in late 1990s (late 2010s) and what were the implications for income and thus consumption. Answering such questions need a thorough investigation and is out of the scope of this study.

external debt servicing), pensions, grant to non-government (total grants/others), and other general public services. For 2001-02 to 2009-10 the quarterly shares of GPSE have been used to quarterise the annual data of GCE. Before Q1FY02 there was no such availability of data on GPSE by the government of Pakistan. For pre Q1FY02 we need to find another indicator which correlates well with the quarterly pattern of GPSE. From the table (below) we can see that the quarterly pattern of GPSEs are very much close to the quarterly pattern of government overall tax revenues – lowest in the first quarter and highest in the last quarter while almost one-fourth in the middle two quarters.

Year	Share of GPSE				Share of Tax Revenues			
	Jul-Sep	Oct-Dec	Jan-Mar	Apr-Jun	Jul-Sep	Oct-Dec	Jan-Mar	Apr-Jun
2001-02	23.7361	21.8636	20.0619	34.3383	19.7085	23.9859	23.4805	32.8251
2002-03	23.1520	25.1034	24.7400	27.0046	20.1258	24.9209	22.9249	32.0284
2003-04	21.2113	26.5369	22.4539	29.7979	18.8727	25.5820	23.7300	31.8153
2004-05	20.2012	28.0886	25.5928	26.1175	21.2285	23.7306	23.5904	31.4506
2005-06	19.2950	29.3945	23.4479	27.8625	21.0408	24.5456	23.2561	31.1575
2006-07	16.9428	25.5767	27.1540	30.3265	21.5380	27.1813	22.5139	28.7668
2007-08	18.0272	26.9403	22.3037	32.7288	20.5177	22.3786	24.7881	32.3156
2008-09	20.3422	25.1254	24.3065	30.2259	22.9782	25.0011	22.5129	29.5077
2009-10	22.0936	23.4190	24.7729	29.7146	20.2864	24.3717	24.2302	31.1117
Average	20.5557	25.7832	23.8704	29.7907	20.6996	24.6331	23.4475	31.2198

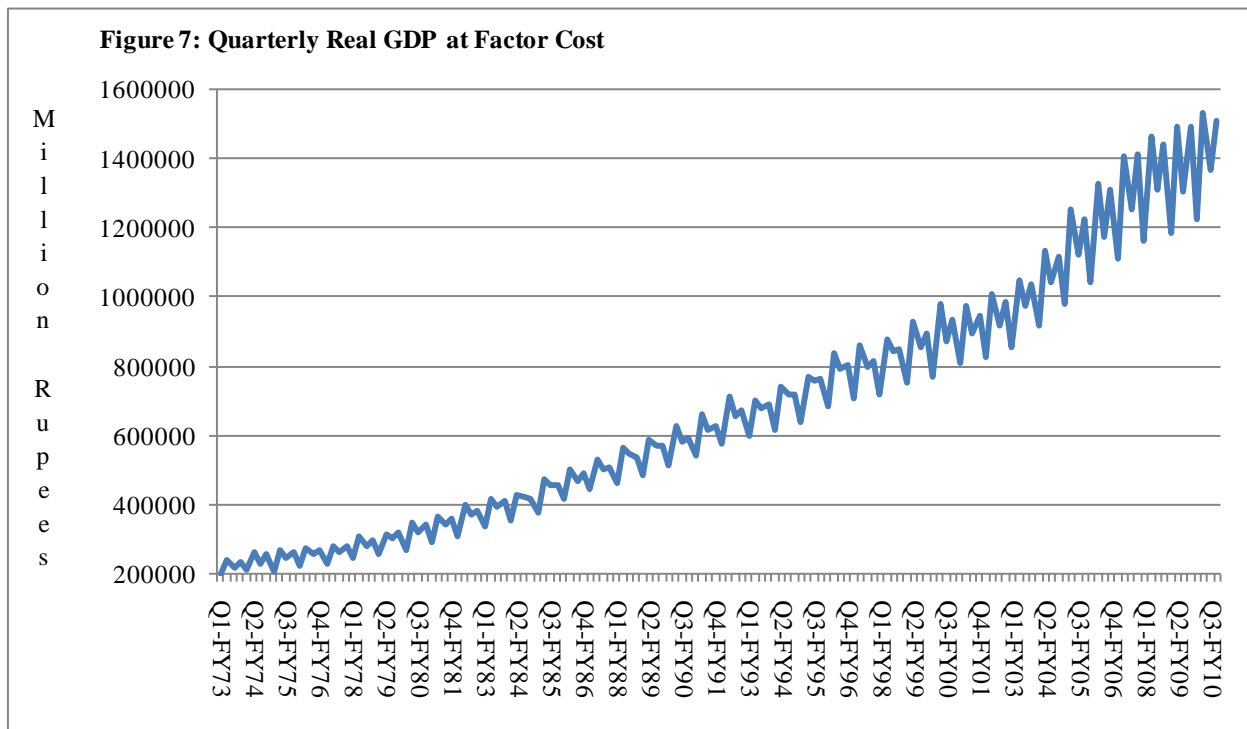

Source: authors' calculations

Thus, we can use the quarterly pattern of government overall tax revenues to quarterise the annual GCE for pre Q1FY02 period. We have converted current price quarterly GCE into quarterly GCE based on 1999-2000 using consumer price index.

4.4 Private Consumption Expenditures

Quarterly private consumption expenditures (PCE) are obtained as residual by subtracting the sum of quarterly GCE, overall investment and net exports from the (production side) quarterly GDP provided in Appendix D.

The overall estimated quarterly real consumption is shown below in figure 6. In figure 7, we have presented the time series plot of overall real quarterly GDP (FC).

5. Analysis of Results

It has been found that on average 21.73 percent of the real GDP was produced in the first quarter during 1999-2000 to 2009-2010 (See Table II in the Appendix I). It has been the lowest share of a quarter in annual real GDP. Second lowest share was observed in the third quarter around 24.43 percent. Highest quarterly share was observed in the second quarter which on average was found to be 27.16 percent. Second highest share was observed in the fourth quarter around 26.68 percent. These results are in line with the findings of Arby (2008) wherein quarterly shares for first, second, third and fourth quarters were found to be 21.8, 26.9, 25.2 and

26.1 percent respectively. As against the dispersion between the quarterly shares in real GDP, half yearly shares were found to be closer (in the ratio of 48.89:51.11) during FY00 to FY11. We have attempted to see in detail the sources of dispersion in the quarterly shares in real GDP. For this purpose, we have calculated dispersion in quarterly shares of various sectors and subsector of GDP (see Table I2 in the Appendix I). Highest dispersion is found to be in the quarterly shares of major crops. Maximum (at 41.37 percent) and minimum (10.29 percent) of quarterly shares are found to be for major crops. This observation is in line with the findings of Arby (2008). Second highest dispersion is found to be in the quarterly shares of finance & insurance subsector. Probably, it is the major crops which are driving the seasonality in the agricultures sector and in finance & insurance, and even to the overall real GDP. This can be said on the basis of fact that (net) operating surplus of financial institutions and insurance companies has been quarterised in this study using the seasonal factors of broad money supply (M2). Seasonality in M2 itself is mainly driven by seasonality in agriculture business credit (see Figure 8, which shows seasonal factors of M2, private agriculture business credit (ABC) and private non-agriculture business credit (NABC) during January 2004 to June 2010 for which we have disaggregated data available).

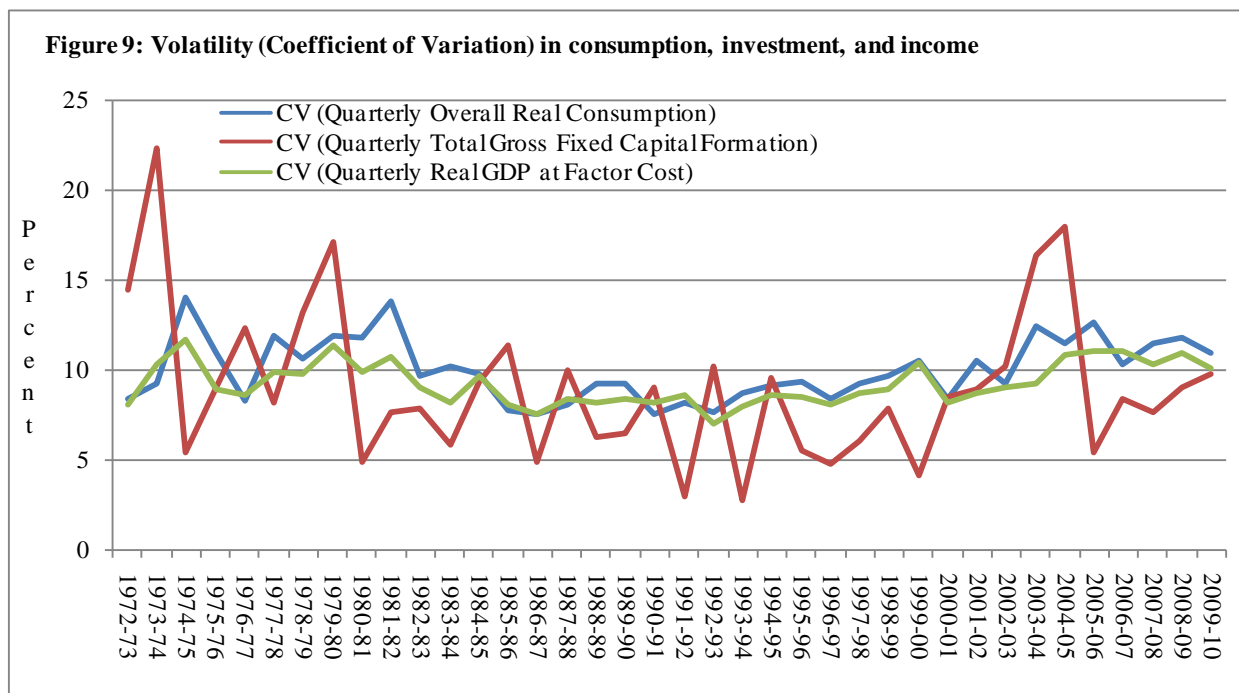

We also investigated, if (during FY2000 to FY2010) the seasonal component in quarterly gross value added (QGVA) by agriculture drives the seasonal components extracted from the QGVA of industrial sector, QGVA of services sector and the overall GDP (FC). Seasonality in industry, services and overall GDP is found to be caused by (in Granger (1969) sense) the seasonality in agriculture sector.

If we analyze the quarterly estimates of various components of expenditures side of the NIAs for FY1973-FY2010 we observe that it is the real investment which is more volatile¹⁴ in

¹⁴ Measured by four quarter coefficient of variation. It does not make any difference to our findings even if we use 4 quarters rolling coefficient of variation. The same is observed if we use the 4 quarters rolling coefficient of variation upon the cyclical components extracted from seasonally adjusted real consumption and income.

Pakistan, followed by consumption and income (see Figure 9). The same is also true if we compare the volatility of the cyclical components of real consumption, investment, and income (see Table I3 in the Appendix). We also observed this phenomenon when we compared the variances of the growth rates in the per capita¹⁵ real consumption, investment and income. Choudhary and Pasha (2013) also found similar results but for annual frequency. Our findings are in line with the observation by Aguiar and Gopinath (2007) at levels and with Gracia et al (2010) at growth.

In order to see whether the moments of annual and quarterised data match, we compared the important moments (like variances and correlation coefficients) calculated from the cyclical components of real consumption, investment, and income as reported in Table I3 in the Appendix. The closeness¹⁶ of these estimated moments gives us due comfort that our quarterised data can be used in business cycle research.

¹⁵ Annual data on population is Pakistan is used from World Bank Development Indicators website (retrieved on February 21, 2013). It is converted in to quarterly population using EVIEWS 7 based on 'linear match last' approach.

¹⁶ The correlation coefficient between the cyclical components of real investment and the real income from observed annual and quarterised data may be different because in the case of Pakistan the government investment crowds in the private investment, and the government investment is intrinsically volatile in Pakistan and thus generates larger (than usually observed) volatility in overall investment in the country during the year, which disappears on aggregation.

6. Concluding Remarks

Pakistan Bureau of Statistics (PBS) compiles NIAs for Pakistan on annual basis. Despite availability of some data on higher frequency like for large scale manufacturing output and merchandise trade, PBS does not provide NIA on quarterly basis which contains a comprehensive picture of economy than provided by the indicators like LSM index. In order to meet needs of the researchers some studies in the past provided estimates of quarterly GDP but from production side only. These studies include Bengaliwala (1995), Kemal and Arby (2004), and Arby (2008). None of these studies provide estimates of quarterly GDP from expenditure side.

Arby (2008) provides the quarterly estimates of the annual GDP from production side (for 1972 to 2005) based on current as well as on current (1999-2000) prices. Realizing the need to provide quarterly production estimates for the last decade, this study provides quarterly estimates of (sectoral and overall) gross domestic production in Pakistan during 1999-2000 to 2009-2010 based on constant prices of 1999-2000 as well as on current prices following Arby (2008). Quarterly GDP production side estimates for 1973-1999 based upon Arby (2008) and those for 2000-2010 based upon this study are combined in here to have a longer QGDP from production side. Then we quarterise the expenditures side of the NIAs. This is first study which provides estimates of various components of expenditures side of Pakistan's GDP for 1972-1973 to 2009-2010. On the production side, we find that the agriculture sector is the main driver of (quarterly) seasonality in Pakistan's NIA statistics. On the expenditure side, we observed that real investment is the most volatile in Pakistan followed by consumption and income. Matching of moments of some core macro variables for the annual and quarterised data suggests that the estimated quarterly data provided in this study can be used in research.

This will be even useful for assessing, analyzing and monitoring the ongoing state and performance of economy by the policy makers if PBS (herself) starts providing the estimates of QNIA on regular basis. Particularly, in the environment of high and variable inflation, QNIA are quite important from policy point of view as in these circumstances one of the assumptions of ANIA (price homogeneity during the year) is violated and summing the current prices data over a year may be less useful.

Table I2: Quarterly Shares (%) and Dispersion (Period Averages for 1999-00 to 2009-10)

Sector/Subsector	Jul-Sep	Oct-Dec	Jan-Mar	Apr-Jun	Standard Deviation
Agriculture	19.22	31.15	22.05	27.58	5.37
Major Crops	10.29	35.93	12.41	41.37	15.94
Minor Crops	39.66	19.60	22.58	18.16	9.94
Livestock	20.50	31.00	28.00	20.50	5.34
Fishing	13.88	28.35	31.58	26.18	7.74
Forestry	20.09	25.61	28.82	25.48	3.62
Industry	23.24	24.42	26.52	25.82	1.46
Mining and Quarrying	24.02	25.03	25.22	25.73	0.71
Manufacturing					
<i>Large-scale</i>	22.64	24.27	27.27	25.82	2.00
<i>Small-scale</i>	22.64	24.27	27.27	25.82	2.00
<i>Slaughtering</i>	18	25	35	22	7.26
Construction	26.84	24.58	23.73	24.85	1.31
Electricity & Gas Distribution	24.53	24.64	23.32	27.51	1.78
Services	22.11	26.74	24.48	26.67	2.20
Transport Storage & Communication	24.64	24.89	25.13	25.33	0.30
Wholesale & Retail Trade	20.93	27.84	25.50	25.73	2.91
Finance and Insurance	11.93	34.80	16.02	37.24	12.88
Ownership of Dwellings	24.67	24.89	25.12	25.32	0.28
Public Administration & Defence	24.40	24.40	25.60	25.60	0.69
Social and Community Services	24.33	24.75	25.22	25.70	0.59
GDP (Factor Cost)	21.73	27.16	24.43	26.68	2.49

Table I3: Moments Comparison for Annual and Quarterised Data (FY1973 to FY2010)

	Annual	Quarterised
Variance of cyclical component Real Consumption	0.00076	0.00080
Variance of cyclical component Real Investment	0.00515	0.00397
Variance of cyclical component Real Income	0.00038	0.00023
Correlation between the cyclical components of Real Consumption and Income	0.57	0.60
Correlation between the cyclical components of Real Investment and Income	0.40	0.08

Appendix J

Table J1: Classification of Quarterly GDP According to Quarterisation Method -Summary

Section	Components of GDP	% Share in GDP (FY2000-FY2010)	Basis of Quarterisation	Formulae/ Quarterly Proportion	References
3.1	Agriculture	23			
3.1.1	Major Crops (MC)	8	Constant Quarterly Proportions (Harvest Calendar)	$VAMC_t^q(c)$ $= VAMC_t(c) * [PRMC_t^q(c) / \sum_{q=1}^4 PRMC_t^q(c)]$	PBS (2004)
3.1.2	Minor Crops (MC)	2.8	Constant Quarterly Proportions (Harvest Calendar)	$VAMC_t^q(c)$ $= VAMC_t(c) * [PRMC_t^q(c) / \sum_{q=1}^4 PRMC_t^q(c)]$	PBS (2004)
3.1.3	Livestock (LS)	11.4	Constant Quarterly Proportions	$VALS_{1t} = VALS_{4t} = VALS_t * (0.175m_t + 0.25(1 - m_t))$ $VALS_{2t} = VALS_t * (0.35m_t + 0.25(1 - m_t))$; $VALS_{3t} = VALS_t * (0.30m_t + 0.25(1 - m_t))$ Where $m_t=0.6$ (share of milk in total livestock).	Kemal and Arby (2004) and authors' calculations
3.1.4	Fishing	0.3	Constant Quarterly Proportions	Quarterly proportions for marine Fish (which is 30 percent of all) are 0.200, 0.307, 0.284, and 0.255 and Land fish (which is 70 percent of all) are 0.112, 0.274, 0.350 and 0.265	PBS (2002)
3.1.5	Forestry	0.5	Constant Quarterly Proportions	0.201, 0.256, 0.288, and 0.255	Quaidian Economic Consultants (2001)
3.2	Industry	25.7			
3.2.1	Mining and Quarrying	2.5	Actual production	Actual production (quarterly) seasonality	PBS MSB
3.2.2	Manufacturing	18.1			
a)	Large-scale	11.8	Monthly LSM Index	Actual production (quarterly) seasonality	PBS MSB
b)	Small-scale	4.9	Monthly LSM Index	Actual production (quarterly) seasonality of LSM	PBS MSB
c)	Slaughtering	1.4	Constant Quarterly Proportions	0.18, 0.25, 0.35 and 0.22	PBS (2002a)
3.2.3	Construction	2.3	Monthly cement production	Actual production (quarterly) seasonality of cement production with lead of one quarter	PBS MSB
3.2.4	Electricity & Gas Distribution	2.8	Constant Quarterly Proportions	0.245, 0.246, 0.233 and 0.275	PBS (2002b)
3.3	Services	52			
3.3.1	Wholesale & Retail Trade	17.6	Indirect approach	Seasonal factors of imports and commodity producing sector	PBS (1995)
3.3.2	Transport Storage & Communication	10.7	Lisman and Sandee (1964)		Lisman and Sandee (1964)
3.3.3	Finance and Insurance	4.5	Indirect approach	M2 seasonality, uniform distribution and constant proportions	Kemal and Arby (2004)
3.3.4	Ownership of Dwellings	2.9	Lisman and Sandee (1964)		Lisman and Sandee (1964)
3.3.5	Public Administration & Defense	6.2	Constant Quarterly Proportions	0.244, 0.244, 0.256 and 0.256	Kemal and Arby (2004)
3.3.6	Social and Community Services	10.1	Lisman and Sandee (1964)		Lisman and Sandee (1964)
Overall	GDP (Factor Cost)	100			
	Actual data based share used	44	Sections 3.2.1-3, 3.3.1, and 3.3.3		
	Constant quarterly proportions used	32	Sections 3.1, 3.2.2 (c), 3.2.4, 3.3.5		
	Lisman and Sandee (1964)	24	Sections 3.3.2, 3.3.4, 3.3.6
